

Ear ringing that sounds like music to your ears?

Dear employee,

All too often we hear about excuses for not wearing your personal protective equipment: too warm, too cold, it itches or hinders you, makes you look like a fool, etc.

Not using your personal protective equipment is a choice you are free to make , but are you considering the consequences of your choice too?

Let's take the example of hearing protection. Not wearing it in noisy environments means exposing your ears to that noise, which can cause ear damage, even after short periods of exposure. Particularly the long term effects should not be underestimated, though: ear ringing, hearing disorders, irritability, or briefly, pain in the ears. And worst of all, these effects tend to be irreversible.

In fact, choosing not to put on your protective equipment is choosing to put up with the consequences.

If you consider things from this point of view, we guess you won't need long to make the right choice.

But the choice is yours.

Kind regards,

The board

Or rather wear your hearing protection equipment?
